

CONTAINER TRANSPORT

HEUFT *conveyor*
HEUFT *CONVEYOR*

The formula 1 track for containers

It achieves top speeds and is impressive due to its high performance and efficiency: the HEUFT conveyor container transport system is a real racing track for all types of empty and full containers. However in contrast to real formula 1 tracks it is extremely quiet, reliable and clean.

The HEUFT conveyor transports individual containers particularly carefully along the filling line whether on single or several lanes. It is extremely robust at the same time and is not worried by the burdens to which it is constantly exposed to. Because it consists of particularly high quality and robust materials and can be cleaned easily.

The HEUFT solution combines these clear advantages with a flexibility which is unparalleled. No matter what the requirements on site look like: the system fits in every bottling hall and ensures that containers are transported carefully, reliably and efficiently even where the demands are high.

It corners well: space-saving and compact

The most varied curve radii, multi-lane transport and low-friction guides - the HEUFT conveyor is suitable for all types of chains in 85 millimetre systems and provides a great deal of flexibility when planning and implementing your conveyor transport equipment.

High-quality standard components such as magnetically stabilised chains, guide rails with plastic profiles which

handle the containers with care and robust conveyor supports can be individually combined and optimally adapted to the conditions on site due to a cleverly devised modular system. The result: a particularly smooth and efficient container flow.

The HEUFT conveyor replaces your present conveyors or fits into the existing systems of other manufacturers without

a problem in a space-saving and compact way.

Hygienic and germ free: a clean solution

Conveyors have to satisfy the highest demands as regards cleanliness and hygiene. After all they transport sensitive food and drink. Therefore HEUFT has developed the system so that all the critical areas are easily accessible. You will search in vain for so-called “dirty corners” where water can collect and dangerous germs can form as regards the HEUFT conveyor.

Dirty water simply drains away due to its open construction which has been optimised for cleaning. Fragments and other types of contamination cannot impede the regulated transport. Because open operating heads and meshed channels do not give dirt the opportunity to accumulate: dirt and broken glass fall through before they can cause difficulties.

The smooth surfaces with few corners and edges make cleaning easy and provide practically no contact surfaces for contamination. Germ formation does not have a chance. The HEUFT conveyor - a clean solution!

Robust, stable and resilient: top quality from HEUFT

Reliability, durability and flexibility are factors which are extremely important particularly along high-speed lines.

Whether vibrations, splashes of water, liquids leaking from containers or detergents: the HEUFT conveyor overcomes such constant burdens without a problem. Because HEUFT attaches the utmost importance to the top quality of the individual components. The

result is an extremely robust and stable construction for which sensitivity is a foreign concept.

But this has no effect on its flexibility. The HEUFT conveyor can be adjusted quickly and without tools so that brand changes can be implemented at very short notice.

The HEUFT conveyor has been constructed so that it is extremely easy to maintain and offers you the very best quality on which you can rely.

Intensive advice and planning: great importance is attached to service at HEUFT!

No two filling lines are the same. You can rely on the support of the HEUFT team of experts when looking for a transport system which fulfils your respective requirements on site exactly. Competent engineers will put together precisely the equipment which you need.

Detailed line analyses, intensive advice and exact planning result in individual

solutions which will fulfil your special requirements completely. A large number of the most varied components and curve radii as well as the choice between open and closed cable routing make it possible to adapt your HEUFT conveyor optimally to the space available and the prevalent hygienic conditions there. Experienced technicians then install your system so that rework is not necessary.

The advantages are obvious: you save cash due to the low development costs, ideal use of space and last but not least optimised overall efficiency - an investment which quickly turns out to be profitable.

Your cost advantages with HEUFT

We do everything in order to combine the very highest quality with fair prices:

- optimised line efficiency
- ideal use of space
- robust construction with high quality components
- modular system - standard components can be combined as required
- motors and jam switches are easy to replace
- all areas are accessible and therefore easy to clean
- fast changeover times
- long service life
- minimum wear and tear
- low failure rates

The HEUFT *line-up*

The HEUFT *synchron*

The HEUFT *relax*

Other HEUFT products

The following products can be used for related tasks:

The HEUFT *line-up*

- controlled distribution of containers onto different lanes
- the prevention of jams and wedged bottles

The HEUFT *synchron*

- conveyor control system with a continuous fine adjustment of the conveyor speeds in real time
- regulates up to two independent conveyor areas with one device
- pressureless bringing together of containers

The HEUFT *relax*

- container fanning out system at the crossover from a single-lane to a multi-lane transport system
- harmonious distribution of the bottle flow in order to make full use of the conveyor capacity

The HEUFT conveyor container transport

for all types of containers

Adjustable curved guide rails, no tools needed
[more] *

Robust guide rail supports
[more] *

Open transport heads
[more] *

Cable routing without catch pans
[more] *

Robust overall construction
[more] *

FUNCTIONS

- single-lane transport of all types of individual containers
- multi-lane transport of all types of individual containers
[more] *

THE ADVANTAGES

- particularly careful transport
- detailed advice and planning by the HEUFT team of experts
- adaptation to the most varied spatial and hygienic conditions
- the development of individual solutions for specialised tasks

- open construction optimised for maintenance and cleaning
- extremely compact and space-saving design
- integration into the existing conveyor systems of other manufacturers does not present a problem
